

## Abstract of the Disclosure

The addition of pulverulent monosaccharides, disaccharides or oligosaccharides to plastisols based on pulverulent organic  
5 polymers and plasticizers results in plastisols with good  
adhesion properties on a large number of substrates employed in  
automobile construction. These plastisols are distinguished by  
good adhesion properties and a high resistance to ageing, and  
can be employed in automobile construction both in shell  
10 construction and in the lacquering line and in the trim shop for  
adhesive, sealing and coating tasks.
